Certificate of Climate-Allocated Heat and Cooling Delivery

This is to certify that Vattenfall will deliver climate-allocated district heating and climate-allocated district cooling to properties in Uppsala owned by Vasakronan AB and its subsidiaries during 2024. The delivery is valid until further notice.

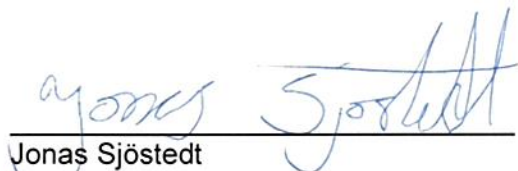

Climate-Allocated Heat: Climate-allocated heat is an add-on product to the main product of district heating. For customers who have climate-allocated heat, biofuel is allocated in the production, corresponding to the amount that is needed to ultimately deliver the required volume of district heating.

In addition to the allocation of biofuel, we also compensate for the fossil CO₂ emissions that arise in connection with the processing and transportation of the above-mentioned amount of biofuel. We do this by purchasing and cancelling emission reductions with the Gold Standard label.

This means that the amount of district heating produced for the customer's district heating supply is climate neutral and has 0 fossil CO₂ emissions.

Climate-Allocated Cooling: Climate-allocated cooling is an add-on product to the main product of district cooling. For customers who have climate-allocated cooling, the amount of district cooling is allocated to the cooling machines we have in the district cooling network. These cooling machines are powered by electricity that is certified (so-called EPD-EI), from hydropower.

The life cycle emissions of hydropower, as well as any refrigerant emissions from the cooling machines, are also climate compensated by purchasing and cancelling emission reductions with the Gold Standard label. This means that district cooling becomes climate neutral with 0 fossil CO₂ emissions for customers who have this add-on product.
